Live communication with the SMS Chatwall®

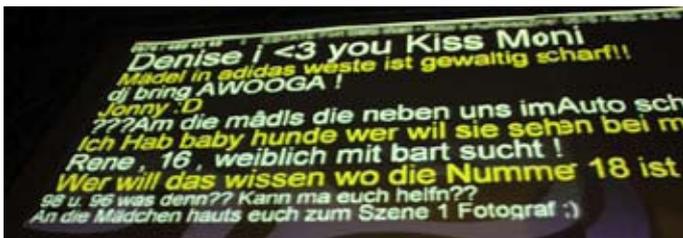

Panel discussion

Symposium, convention

The **SMS Chatwall** receives short messages and shows them via video and projection systems. The SMS Chatwall is the ultimate **SMS-to-projector** system for **live communication** at conventions, symposia, lectures, press conferences, panel discussions, discotheques, parties and events.

Everyone in the audience is invited to **send a personal message from their cell phone to a telephone number shown on the screen**. The SMS Chatwall receives the messages just like a cell phone does, with no need for an internet connection. After a few seconds the message is shown on the screen.

Over 30 Party in the ICC Dresden

SMS Chatwall 4.0 has extensive improvements: the previous display module has been improved through the inclusion of many design possibilities (variable line spacing, fonts and colour adjustments, setting the fonts for the extended displays). The SMS Chatwall now has an additional **Flash display module** and a new **Flash-ticker-display**. SMS Chatwall can now be integrated into the **VJ-Software ArKaos GrandVJ**, enabling you to combine **visual effects** with the display of the short messages you receive.

Nickname feature: members of the audience can check into the SMS Chatwall and **chat** there **with their own Nickname**. The check-in keyword can be freely defined by the admin. Die Installation is simple. After putting you own **SIM card** into the GSM module and starting the programme, the SMS Chatwall functions as a **stand-alone** or it can be administered manually.
Further highlights include the communications between the visitor and the event organiser as well as garnering of the numbers that use the SMS Chatwall in order to create a feedback channel to the users.
